

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A container with a comb for applying a substance, the container with a comb comprising:

a laminated container body having a neck portion, and including an outer layer and an inner layer delaminatable from the outer layer;

a hollow comb having a shaft and one or more discharge orifices;

a cap member formed at a lower end of the shaft and fitted on the neck portion of the laminated container body, such that a liquid in the laminated container body is discharged from the one or more discharge orifices, wherein the cap member is formed as a separate body from the ~~shaft~~shaft;

a pump cylinder extending from the cap member into the laminated container ~~body~~body; and

a stem extending from the shaft into the pump cylinder, the stem having a lower end portion to which a cylindrical piston is ~~provided, the stem and the cylindrical piston~~provided, the stem, the cylindrical piston and the comb being biased upwardly and being vertically movable with respect to the laminated container body and the cap ~~member by means of the comb member~~member,

wherein the shaft has a depression rod for depressing the stem, the cylindrical piston and the comb.

2. (Currently Amended) A container with a comb for applying a substance, the container with a comb comprising:

a double container body comprising:

an outer container;

an inner container which is shrinkable upon depressurization; and

a neck portion;

a hollow comb having a shaft and one or more discharge orifices;

a cap member that is formed at a lower end of the shaft and fitted on the neck portion such that a liquid in the inner container is discharged from the discharge orifices,

wherein the cap member is formed as a separate body from the ~~shaft~~shaft,

a pump cylinder extending from the cap member into the inner container, ~~and~~

a stem extending from the shaft into the pump cylinder, the stem having a lower end portion to which a cylindrical piston is ~~provided, the stem and the cylindrical piston~~provided, the stem, the cylindrical piston and the comb being biased upwardly and vertically movable with respect to the double container body and the cap ~~member by the comb member, and~~

the shaft has a depression rod for depressing the stem, the cylindrical piston and the comb.

3. (Currently Amended) A container with a comb according to ~~claim 1, further comprising a depression rod protruding~~claim 1, wherein the depression rod protrudes laterally outwardly from a lower portion of the shaft.

4. (Previously Presented) A container with a comb according to claim 1, further comprising a stop cylinder that prevents an escape of the cylindrical piston, the stop cylinder being fixed to an upper end portion of the pump cylinder and being inserted into an upper part of the pump cylinder.

5. (Currently Amended) A container with a comb for applying a substance according to ~~claim 1,~~claim 8, further comprising a cap member having a peripheral wall, a lower half of the peripheral wall is fitted on the neck portion of the laminated container body or on the double container body, and an inward flange protruding from an intermediate portion of the peripheral wall, an inner circumference of the inward flange is continuously connected to the pump cylinder, and a lower end portion of the shaft that expands radially outward to define an expanded cylinder that is fitted vertically slidably within an upper half of the peripheral wall,

atthe shoulder portion for depressing that is formed between the expanded cylinder and other portions of the shaft excluding its lower portion, the stem is provided at its upper end portion with an outer flange for fitting to an inner surface of the expanded cylinder, and a spring for upwardly biasing the outer flange, the spring being between the outer flange and the inward flange.

6. (Currently Amended) A container with a comb for applying substance according to the claim 1, wherein the outer layer of the laminated ~~body has a retentive shape.~~
body is a shape resistive stiff layer.

7. (Currently Amended) A container with a comb for applying a substance according to the claim 2, wherein the outer ~~layer of the outer container has a retentive shape.~~
container of the double container body is a shape resistive stiff layer.

8. (New) A container with a comb for applying a substance, the container with a comb comprising:

a laminated container body having a neck portion, and including an outer layer and an inner layer delaminatable from the outer layer;

a hollow comb having a shaft and one or more discharge orifices;

a cap member formed at a lower end of the shaft and fitted on the neck portion of the laminated container body, such that a liquid in the laminated container body is discharged from the one or more discharge orifices, wherein the cap member is formed as a separate body from the shaft;

a pump cylinder extending from the cap member into the laminated container body; and

a stem extending from the shaft into the pump cylinder, the stem having a lower end portion to which a cylindrical piston is provided, the stem, the cylindrical piston, and the comb being biased upwardly and being vertically movable with respect to the laminated container body and the cap member,

wherein the shoulder portion for depressing the stem, the cylindrical piston and the comb.
